

LIZA ALAM

Full Stack Developer, React, Next.js and Node.js

iamlizaalam@gmail.com | +92 324 1703134 | github.com/lizaalam | linkedin.com/in/lizaalam

PROFESSIONAL SUMMARY

Full stack developer who has learned most of what I know by building real things and getting feedback on them. I work with React, Next.js, Node.js and Express on the frontend and backend side, along with FastAPI, PostgreSQL and SQLite. Right now I am splitting my time between two internships, one where a senior developer mentors me directly through React and Git workflows, and another on an AI healthcare platform where I build patient facing features and review UI consistency. Outside of work, I have designed and built the backend for a security operations platform on my own, including an automated response module that decides how to react to threats without a human clicking every button. I like learning new tools quickly and I care about writing code that someone else can actually read.

TECHNICAL SKILLS

Frontend: React.js, Next.js, JavaScript (ES6+), TypeScript, Tailwind CSS, Material UI, ShadCN UI, HTML5, CSS3, responsive design, Figma

Backend: Node.js, Express.js, FastAPI (routers, Pydantic models, path and query parameters), RESTful API design, modular architecture with clear separation of concerns, JWT authentication, SSR/SSG, API routes

Databases: MySQL, MongoDB, PostgreSQL, SQLite, NeonDB, relational schema design, raw SQL (SELECT, INSERT, UPDATE, joins, COUNT and GROUP BY), query optimisation, working across SQLite and PostgreSQL with portability in mind

Cloud, DevOps and Tools: AWS (EC2, S3), Vercel, Docker, Redis, Git and GitHub (branching, commits, pull requests, pushing to specific branches), Git Bash, Postman, npm, environment management (.env files, keeping secrets out of commits)

EXPERIENCE

Full Stack Developer Intern at udevs

2026 | Islamabad, Remote

- Working closely with a senior developer who reviews my code line by line and walks me through the reasoning behind decisions before anything ships, so it has felt more like a mentorship than a typical internship.
- Building responsive, reusable React components from design files and learning production Git workflows, branching, and code review as part of a small team.

Software Engineer Intern at Carbonrepro

June 2026 to Present | Remote

- Working under the guidance of the engineering team on an AI healthcare platform built with Next.js and FastAPI, building patient facing features including a new appointments dashboard page.
- Went through the platform's agent pages one by one during a UI consistency review, catching mismatched accent colors and inconsistent navigation before they reached real users, and learned a lot from how the senior engineers approached the fixes.

PROJECTS

Security Operations Platform with Automated Threat Response

Python, FastAPI, PostgreSQL, Docker, React, JWT, OAuth, TOTP

- Designed and built a security operations platform on my own as a final year project, meant to give a small team a single place to see what is happening across their network and respond to it.
- The core piece is an automated incident response module. It takes in alerts, scores how risky they are, and decides what to do next, from logging it quietly to sandboxing and blocking the source through Docker and iptables, and every action can be rolled back.
- Also built the identity and access side of the platform, including brute force lockouts, impossible travel detection based on login location, JWT and OAuth login, and TOTP based multi factor authentication.
- Added a threat intelligence module that pulls in real indicator of compromise data from multiple sources and a live dashboard that escalates alerts automatically based on how long they have been sitting unresolved.
- Moved the whole project from SQLite to PostgreSQL partway through once the data started growing, and used Docker to run services in isolated containers.

AI Healthcare Platform, Clinical Assistant and Patient Monitoring

Next.js, TypeScript, FastAPI, Prisma, SQLAlchemy, Tailwind

- Built frontend features for a healthcare platform aimed at doctors, including a clinical assistant that answers questions by pulling directly from uploaded medical documents and shows where each answer came from.

- Built out document handling for that assistant, letting doctors select, archive, or delete files with a confirmation step, and cleaned up a memory leak that was slowing the page down over time.
- Also worked on a remote patient monitoring dashboard, including the form doctors use to log patient readings, redesigning the save button, error messages, and confirmation toast so the flow felt less confusing.
- Tracked down a bug where a doctor's account was not linking correctly on login, which turned out to be caused by a database connection that was not set up to handle multiple requests properly, and fixed it by switching to a pooled connection.
- Worked through a merge conflict where two different people had built the same page two different ways, and had to actually read both versions closely to figure out which approach to keep.

CERTIFICATIONS

- Foundations of Project Management, Google, via Coursera (2026)
- Build Dynamic User Interfaces (UI) for Websites, Google, via Coursera (2026)

VOLUNTEERING

- Team Lead, Air University Computing and Innovation Society (AUCIS), Oct 2025 to May 2026

EDUCATION

BS, Information Technology, Air University, Islamabad

Sep 2023 to 2027

Relevant coursework: Web Technology, Databases, OOP, Software Engineering, Data Structures, Networking, AI

Languages: English (Professional Working Proficiency), Urdu (Native)
